Definition

- Differentiated service delivery has been defined as “a client-centred approach that simplifies and adapts HIV services across the cascade, in ways that both serve the needs of people living with HIV better and reduce unnecessary burdens on the health system” (ref.IAS)

DSD for PWUD: Key issues for consideration in Guideline Development

- For DSD, PLHIV are broadly classified into Stable and Unstable for the purposes of streamlining services
- This broad classification is not often suited for key populations, especially PWUDs for the following reasons:
 - Stigmatization and Discrimination
 - Legal environment (criminalisation)
 - High mobility while health facilities are static
 - Peculiarity of ancillary services required by PWUDs such as legal aid support, GBV intervention, MHPSS- these are necessary incentives for service uptake and retention in care
 - Poor health seeking behaviour that seek alternative to facility-centered
