

# Mitigation of HIV Treatment Interruption Using Machine Learning, Kenya

Lilly Nyagah, Strategic Information Lead,  
NASCOP/Ministry of Health, Kenya

# Treatment Interruption a Barrier to HIV Epidemic Control

Kenya's performance against 95-95-95 targets is at **95-97-94\***

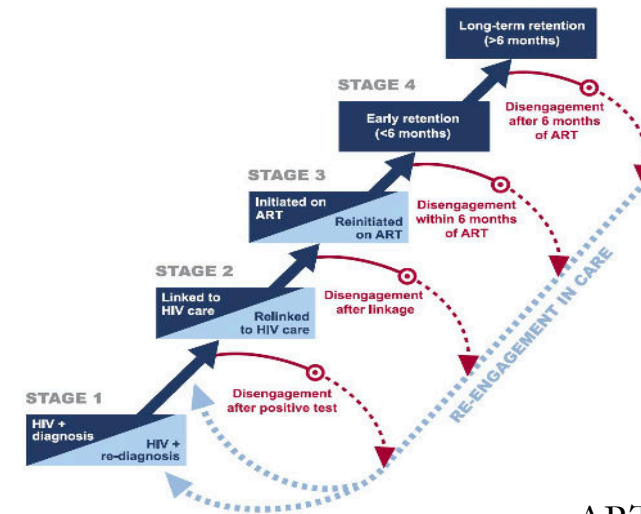

Life-long ART is essential for sustained virologic suppression, reduced HIV morbidity and reduced risk of onward transmission

Treatment interruption slows down the progress towards HIV epidemic control

Traditional linear cascade useful, but does not account for nuances in the ingress and egress from care

Cyclical cascade with potential to provide deeper insights for targeted interventions

Utility of de-duplicated, longitudinal dataset of HIV population for analysis of cyclical cascade remains uncertain

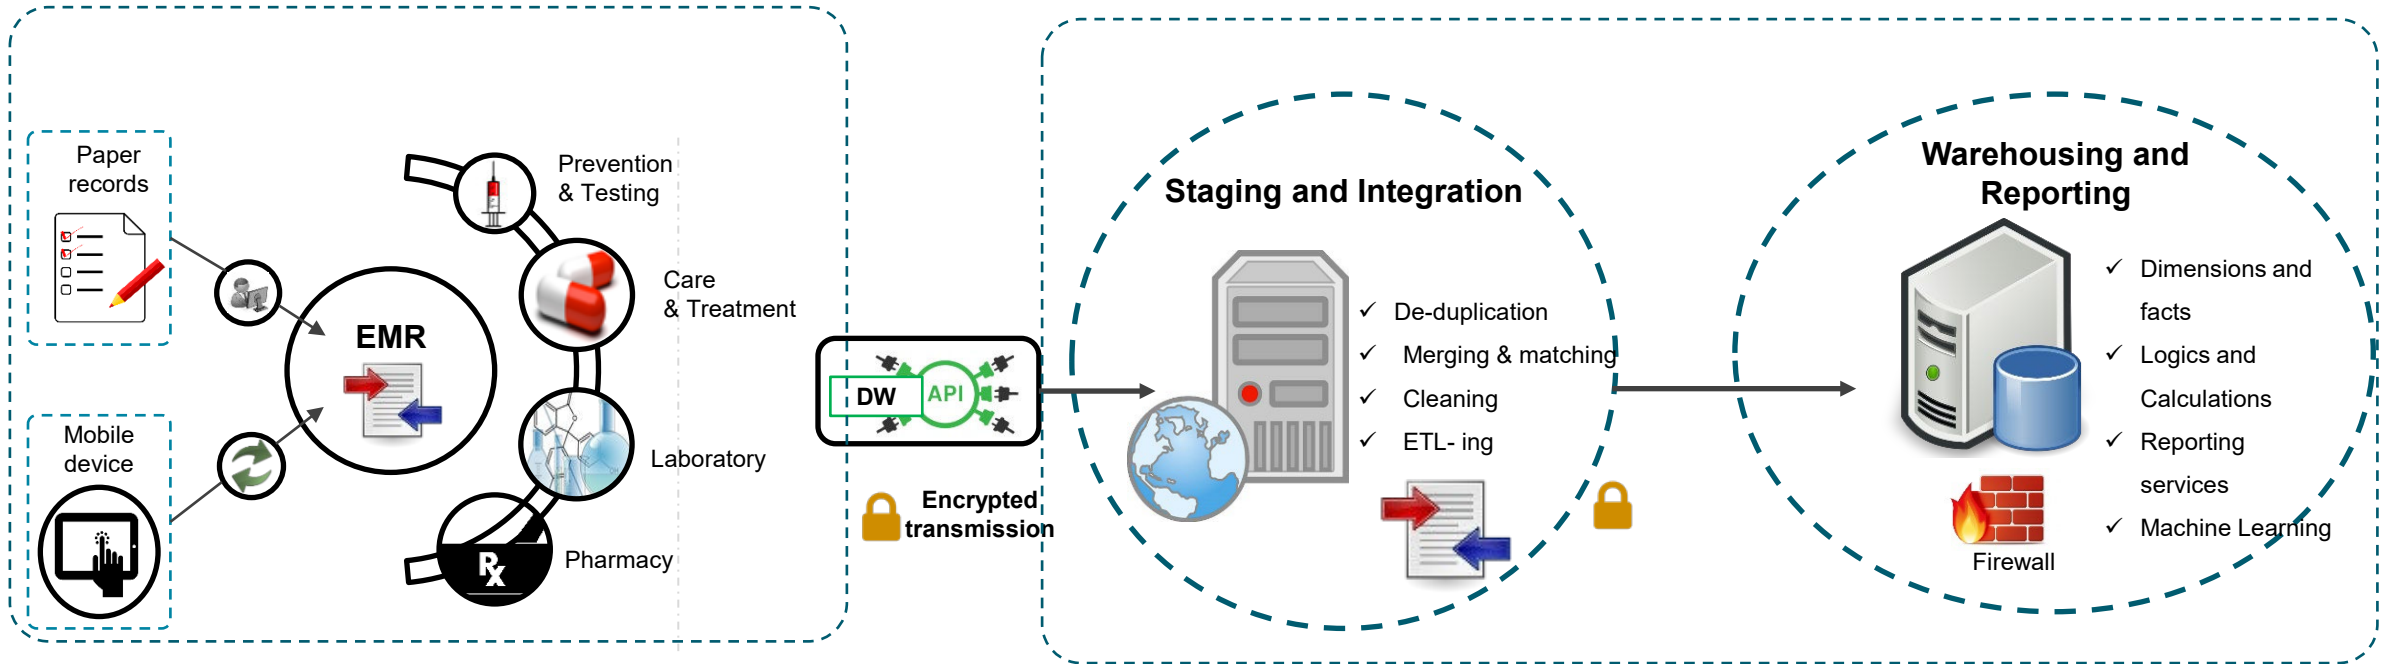

ART Cyclical cascade\*

ART Linear cascade\*

# Data Transmission, De-duplication, and Data Warehousing

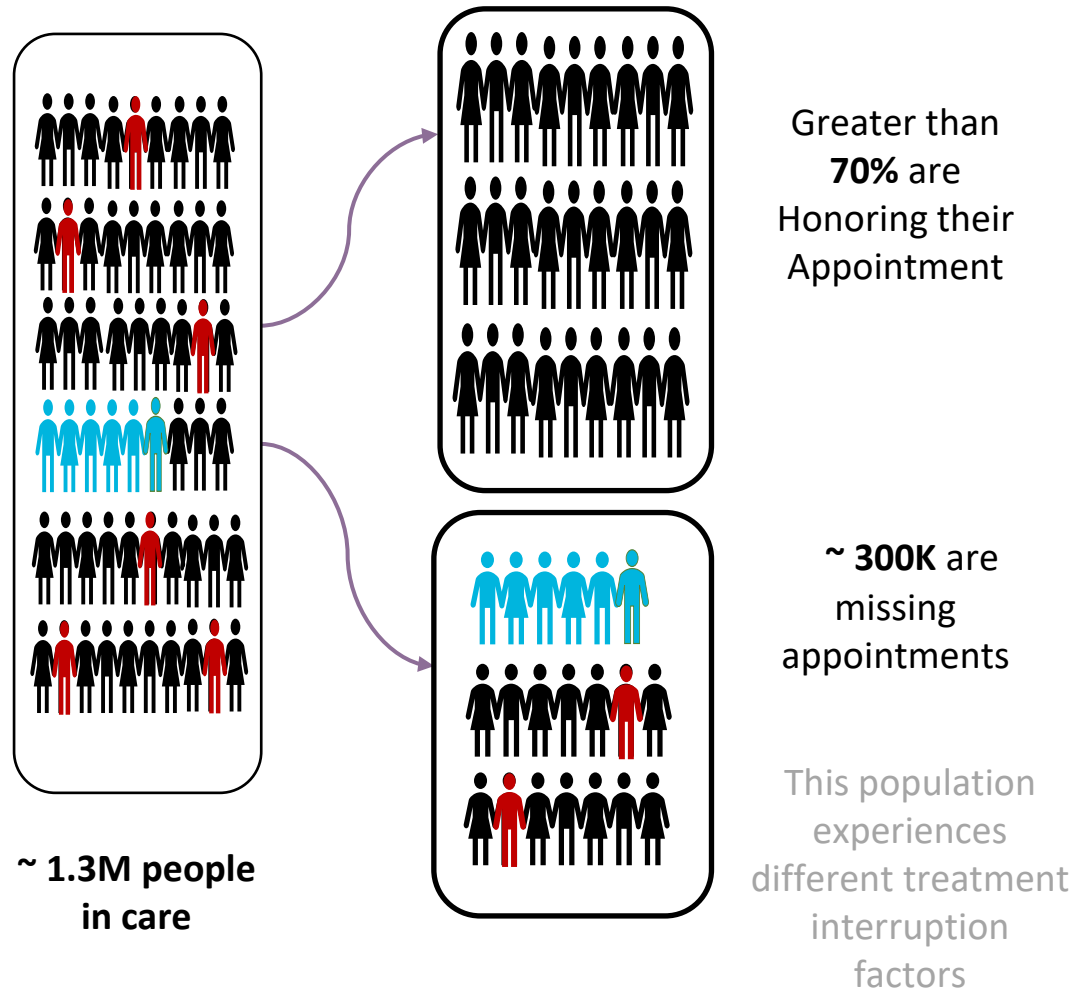

- Demographic, clinical care data is recorded in Electronic Medical Record (**EMR**) system during routine clinical visits.
- National ID number is used to derive a National Unique Patient Identifier (**NUPI**)

- NUPI is applied for records matching and deduplication
- Data is cleaned and **ETL**'d (Extract, Transform and Load) for various use cases

- Longitudinally linked dataset of unique patients living with HIV (**PLHIV**) is available in an easy to consume approach

# The IIT ML Solution in Kenya

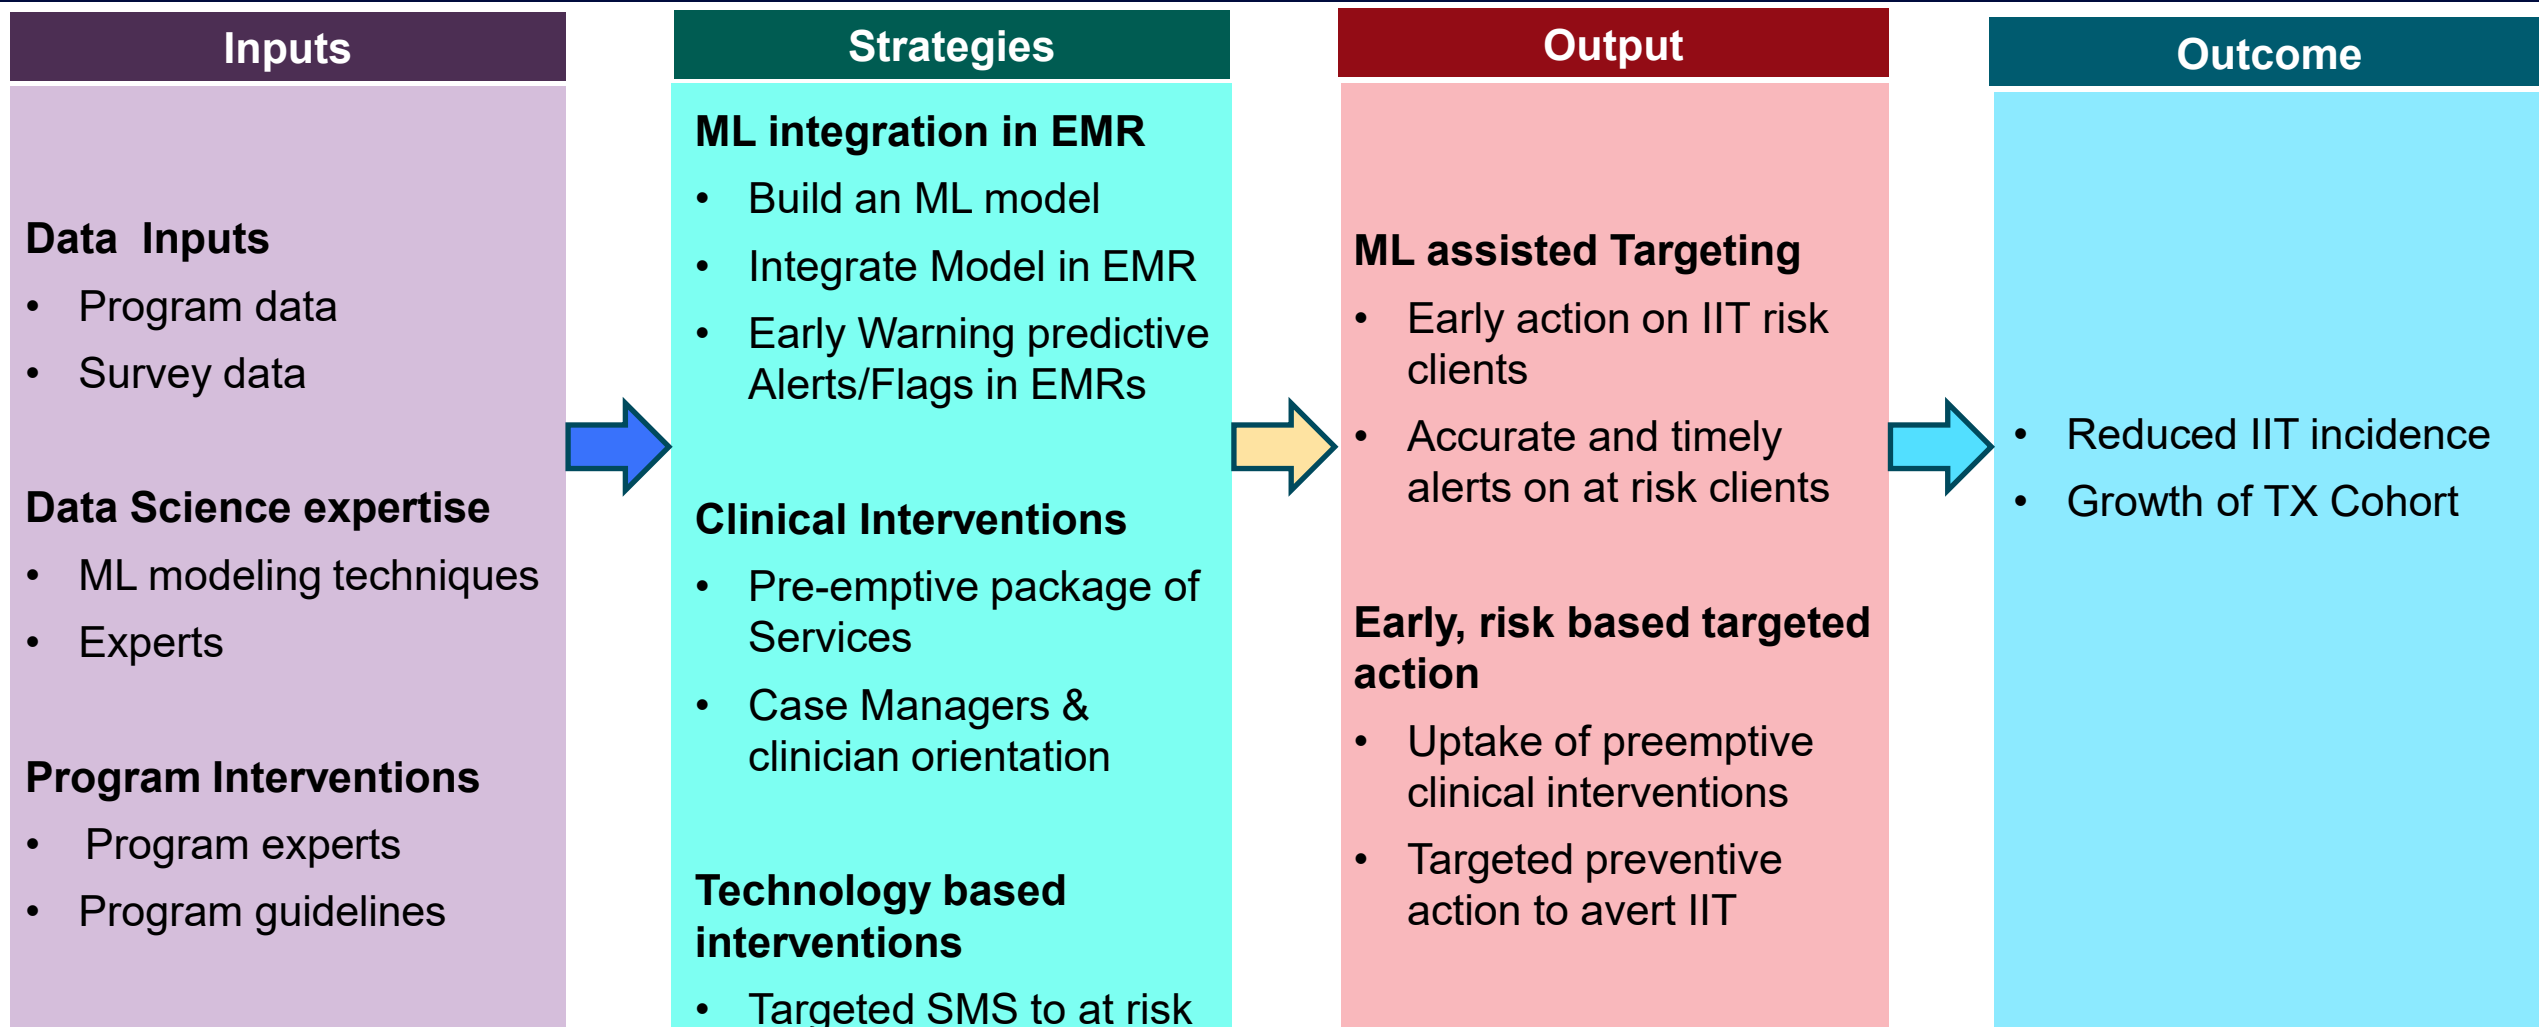

## Common Problem in HIV Care

- The standardized approach to HIV treatment delays timely responses to interruptions and relies on manual tracing of clients with interruptions in treatment (IIT), leading to inefficient use of resources.

## IIT ML

- This is a ML powered alert system embedded in KenyaEMR that identifies and flags clients at risk of interrupting HIV treatment, enabling proactive and targeted interventions before interruptions occur.

# Harnessing ML at the Frontline for Treatment Continuity

# Approach for Implementing IIT ML Model

## Clients/ Persons'

Clients with different risk profiles visit facilities

### Problem Statement:

#### Current Clinical Practice

- Non-standard processes
- Provider discretion
- Missed opportunity

#### Current Public Health Practice

- Manual data analysis
- Delayed intervention

## Facility Level

- Standard of care is similar for all clients
- Delayed Response (after IIT)
- Manual Tracing of IIT clients

### Intelligent clinical decision support

- **Clinical alert system** for Frontline Workers

### Features

- Intelligent IIT risk alerts and flags
- Line-list of High IIT-risk clients
- Targeted care plans to avert IIT

## Above Site

- De-identified data is transmitted and hosted in the NDW
- Manual Data Analysis to identify Risk factors for IIT

### Intelligent public health decision support

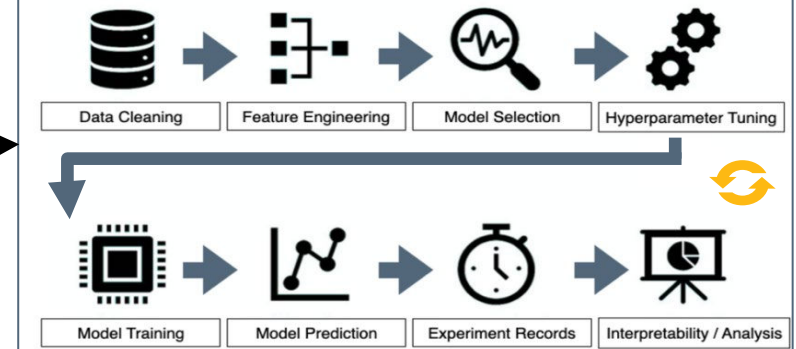

- Public Health **Early Warning System** for IIT

### Features

- Risk Mapping of IIT hotspots
- Pre-emptive action to avert IIT
- Reduce missed opportunities for interventions

## ML Model Development

## Prediction models

### Predictive IIT model

Continuous feedback

\*\*\*

Model updates with new data

Model integration in HIS

# ML for IIT Prevention

Clinical decision support:  
Intelligent Alerts and high IIT risk line-lists

## Intelligent decision support for predicting clients at High IIT risk for action

### What is it?

- An intelligent alert system that relies on a machine learning model to identify and flag persons at risk of Interrupting in Treatment (IIT)

### How does it work?

1. Clinical providers receive alerts regarding persons risks status and scores
  2. Providers can customize interventions accordingly with guidance on risk factors to avert the risk
  3. Availability of reports to guide programming & monitoring
- Provide targeted appointment SMS to clients at risk of treatment interruption

The screenshot displays the KenyaEMR interface for a patient named WATIRI. Key features include:

- Alerts:** "Eligible for COVID-19 Vaccination", "IIT high risk: 70.0%", "On ART", "Low Level viremia", and "Due for CACX Screening".
- Information:** "Patient has missing National ID Number and other registration identifiers."
- HIV Care:** Last WHO stage: WHO STAGE 1 ADULT (01-Feb-2022), Last CD4 count: 528 cells/uL (28-Jan-2015), Last CD4 percentage: None, Last Viral Load: 200.0 copies/ml (01-Jun-2022), Regimen: TDF/3TC/DTG, Started: 20-Nov-2019.
- IIT Risk Score:**

Risk Score	0.702508807
Evaluation Date	29-Jul-2022
Description	High Risk
Risk Factors	RecentIIT 3   RecentUnscheduled 4   OptimizedRegimen Y   Stable Y   NumHIVRegimens 1

# Package of Care to Avert IIT Based on Risk Profiles

Risk Level	Pre-emptive Interventions With Personalized Care
<b>High Risk</b>	<p><b>Appointment management:</b> Individualized discussion on appointment preference;</p> <ul style="list-style-type: none"> <li>○ Give options for early drug pick up,</li> <li>○ ARV pick-up or by treatment buddy/supporter/from nearby facility,</li> <li>○ Enrollment into SMS/phone reminder program,</li> <li>○ Overnight medication pick-up reminders on clinic eve,</li> <li>○ Missed appointment follow-up</li> </ul> <p><b>Assign Case Managers</b></p> <ul style="list-style-type: none"> <li>○ Targeted follow-up</li> </ul> <p><b>Robust client literacy</b></p> <ul style="list-style-type: none"> <li>○ Minimum 3 sessions of treatment education/support</li> </ul> <p><b>Differentiated Service delivery</b></p> <ul style="list-style-type: none"> <li>○ Community drug delivery</li> <li>○ Community pharmacy (new)</li> </ul>
<b>Medium Risk</b>	<p><b>Appointment Management</b></p> <ul style="list-style-type: none"> <li>○ Appointment management (reminders etc.)</li> </ul> <p><b>Case managers</b></p> <ul style="list-style-type: none"> <li>○ For targeted follow-up &amp; support</li> </ul> <p><b>Treatment literacy</b></p> <ul style="list-style-type: none"> <li>○ Minimum 1 session of ongoing patient education</li> </ul> <p><b>DSD</b></p>
<b>Low Risk</b>	Per standard of care

# How Clinicians Interact With the IIT Model

The screenshot displays the KenyaEMR interface. On the left is a navigation menu with options like Home, Radiology, Service queues, Laboratory, Providers, Referrals, Appointments, Billing, Case management, In Patient, Procedures, and Lab Manifest. The main area is divided into three panels:

- Case Management:** Shows 'Active cases (1)' and 'Discontinuation cases (0)'. A table lists active cases with columns for Names and Start Date. One case is listed: SYLVIA SYLVIA SYLVIA, Start Date: 8/25/2024.
- Case Management Form:** Contains Demographics (Case Manager: EUGENE EUGENE EUGENE), Relationship Info (Patient: Sylvia Sylvia Sylvia, FEMALE - 2004, OpenMRS ID: MGJLF7; Relationship: CASE MANAGER), Start Date (08/25/2024), End Date (mm/dd/yyyy), and Any additional notes.
- Clinical Encounter:** Features a 'Package of interventions' section with 'Save and close' and 'Discard' buttons. Below is a list of interventions offered, including Appointment management, Assigning Case managers, Robust client literacy, and Expanding Differentiated Service Delivery. Under 'Appointment management interventions', there are several checkboxes for tasks like individualized discussions, plan agreements, reminders, follow-ups, and physical tracing.

Able to assign a case to a case manager in the EMR and offer interventions to avert the risk of a client being IIT.

# Results: IIT Model Predictions vs. Actual Outcome

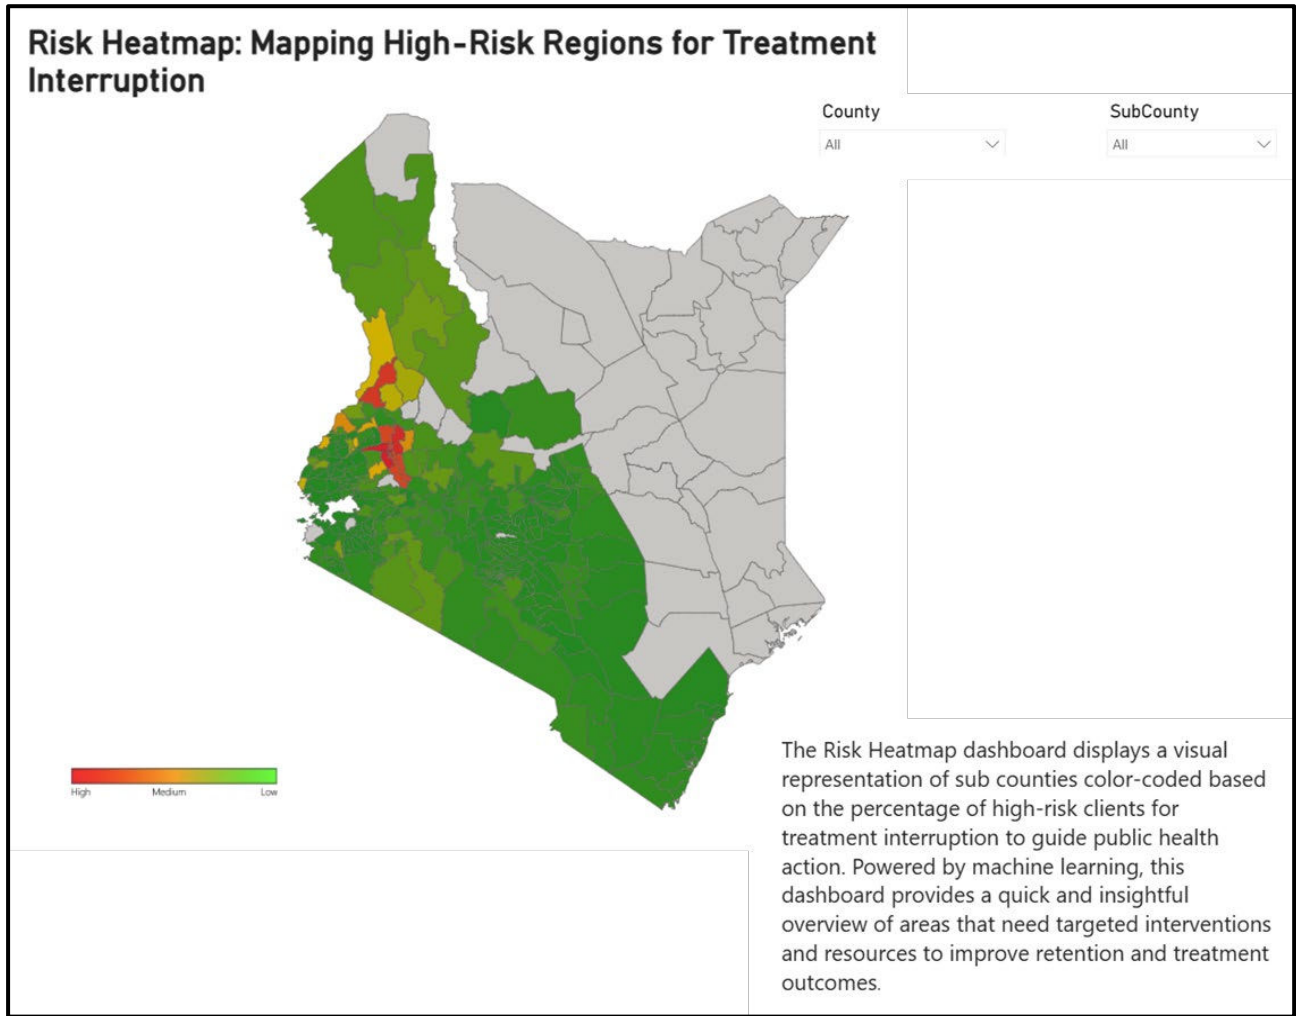

These results are based on data from 1<sup>st</sup> July 2024 through 30th September 2024.

## IIT Prevalence by ML Risk Category

	Total Appointments	High Risk	Medium Risk	Low Risk
Total	1,120,784	280,196	280,196	560,392
%	100%	25%	25%	50%
IIT	35,374	22,511	7,246	5,617
% IIT	3.16%	8.03%	2.59%	1.00%

Among the 50% of clients considered high or medium risk, the rate of IIT was 5.3%, representing 84% of all instances of IIT.

# Leveraging on the IIT Model for Public Health Action

Sub-County	% of Clients With IIT High Risk
Turkana South	0.21
Turkana Central	0.16
Turkana East	0.14
Loima	0.14
Turkana West	0.11
Turkana North	0.11

Grey regions represent underserved counties based on Low HIV prevalence and digital systems penetration within the ASAL counties. **GoK is working on expanding digitization as part of UHC initiatives**

# IIT Patterns and Progression: A Longitudinal View from Project HIFADHI

From February to June 2025, IIT rates showed a steady decline, indicating potential recovery or improved follow-up mechanisms. Predictive targeting of high-risk clients may be contributing to improved retention outcomes.

# Navigating Challenges, Seizing Opportunities

Challenge	Solution
 Variable Data Connectivity	"Offline-First" EMR integration for reliable use in low-bandwidth settings
 Workflow Integration	Co-creation with clinicians to design usable alerts and action plans.
 From Data to Action	Automated bulletins & TWG forums to ensure predictions trigger a consistent public health response.

## Future Opportunities

- Smarter AI: Evolve from predicting "who is at risk?" to prescribing "which intervention works best?".
- Continuous Learning: Use intervention outcomes to continuously re-train and improve model accuracy.
- System-Wide Scale: Leverage the proven blueprint and data infrastructure to expand into TB, Maternal Health, and beyond

# Conclusion & The Path Forward

- Kenya has successfully deployed a scalable AI model to proactively reduce treatment interruption, demonstrating the power of combining strong data infrastructure (EMR, NUPI) with cross-functional collaboration for tangible public health impact.

**Together, we are turning predictive insights into preventative action.**

## **Scaling the Impact: Our Strategic Priorities**

Priority	Key Actions
 Expand Predictive Analytics	Apply the model to HTS, PrEP adherence, and TB prevention.
 Enhance Client Engagement	Integrate risk insights into client-facing apps & SMS for self-management
 Strengthen Governance	Develop policy frameworks for sustainable and ethical digital health
 Foster Regional Collaboration	Share the blueprint to support replication & cross-country learning

# Thank You!
